

What will the Earth
look like in 50 years - why
is it worth protecting
the environment?

A row of Moai statues stands on a grassy field. In the background, a steep, layered cliff rises under a blue sky with scattered clouds. The ocean is visible on the right side of the image.

Future of our planet

There are as many places, cultures and different stories as there are people on the Earth. However, each continent has a different environmental situation. Of course, all because of the location, climate etc.

Africa

In Africa, the main problem is water scarcity, frequent droughts and poorly fertile soil, which results in the appalling conditions of natural production in Africa. Plantation agriculture and low-temperature agriculture do not improve this situation, because Method 1 disturbs plant diversity with the monoculture of crops. The 2nd way causes massive desertification.

A giant panda is shown in profile, facing left, eating bamboo. It is sitting on a rock, with its black and white fur clearly visible. The background is a rocky, natural habitat with some green bamboo leaves in the foreground.

Asia

This continent is a very heavily populated one. Farmers always wait for the summer monsoon, because all crops, e.g. rice, depend on it, because in Asia it is the basic component of the diet.

North America

- In North America, approximately 60 million tons of food, worth approximately \$ 160 billion, are wasted each year. This is 1/3 of domestic production. Discarded food begins to emit the greenhouse gas methane as it decomposes. This accelerates the warming of the climate, and as a result - an ecological catastrophe. Food waste is treated as an ethical problem, but it is an environmental one.

South America

- The trees in the Amazon jungle are called the lungs of the Earth. Unfortunately, an unimaginable amount of them is cut every year, which makes the trees unable to produce oxygen. What is worse, Amazon animals, especially monkeys, lose their home

A large, jagged iceberg floats in the dark blue ocean. The iceberg has a prominent peak and several smaller sections, with visible ice textures and some icicles hanging from the edges. The sky above is filled with soft, grey clouds. The water in the foreground shows gentle ripples.

Arctic

- The problem in this frosty region is the melting of the glaciers. All because of global warming. Polar bears swimming on the crash feel it the most. They have very thick and dense fur which makes them far too warm.

Summary

- In conclusion, in many places around the world there are serious problems of climate, ethics, nature and others. If we don't act, current problems will get worse and new ones will emerge. It is not known what the Earth will look like in 50 years, but one thing is for sure. **TIME TO ACT!** It is worth taking care of our planet. After all, someone will live after us. Thank you for your attention!

A close-up photograph of a red pushpin with a black stem, pinned to a yellow map. The map shows some text like 'PALCO' and 'SOLARE'. The background is blurred, showing another red pushpin.
